

## Judgments

- **Well-formed Type (Type Formation)**  $\Gamma \vdash A$  type
- **Judgmentally Equal Types**  $\Gamma \vdash A \doteq B$  type
- **Well-formed Term**  $\Gamma \vdash a : A$
- **Judgmentally Equal Terms**  $\Gamma \vdash a \doteq b : A$

## Context (Telescope)

$x_1 : A_1, \dots, x_{k-1} : A_{k-1}(x_1, \dots, x_{k-2}) \vdash A_{k(x_1, \dots, x_{k-1})}$  type

## Dependent Stuff

- **type family (dependent types)**  $\Gamma, x : A \vdash B(x)$  type
- **section (dependent terms)**  $\Gamma, x : A \vdash b(x) : B(x)$

**NOTE** Why is it called “section”? Category warning!

**TODO**

## Rules

### • Structural Rules

1. Equivalence, as you expect
2. Variable Conversion

$$\frac{\Gamma \vdash A \doteq A' \text{ type} \quad \Gamma, x : A, \Delta \vdash \mathcal{J}[B(x)]}{\Gamma, x : A', \Delta \vdash \mathcal{J}[B(x)]}$$

**NOTE** the following rule (*element conversion*) is derivable, as we'll see later

$$\frac{\Gamma \vdash A \doteq A' \text{ type} \quad \Gamma \vdash a : A}{\Gamma \vdash a : A'}$$

3. Substitution

$$\frac{\Gamma \vdash a : A \quad \Gamma, x : A, \Delta \vdash \mathcal{J}}{\Gamma, \Delta[a/x] \vdash \mathcal{J}[a/x]}_{\text{SUBST}}$$

This  $\mathcal{J}$  here stands for whatever judgment we are talking about. It could be *type formation*, *judgmental equal terms/types*, or *typing judgments*. In real life there will be 4 rules here.

Also note how  $\Delta$  is getting substituted because it can depends on  $x$ .

**NOTE** Usually we want SUBST to be an admissible rule. For today, we see it as an axiom.

4. Weakening

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma, \Delta \vdash \mathcal{J}}{\Gamma, x : A, \Delta \vdash \mathcal{J}}_W$$

Note how we are adding  $x$  to  $\Gamma$ .

5. Contraction, which is derivable from how we defined substitution.

**TODO** I think defining substitution as an axiom is not a good idea, especially when it mixes substitution and structural properties up. My intuition is that structural properties are a direct consequence of how you define substitution, which in turn is the very core definition of the semantics of your type theory.

6. Generic element (variable rule)

$$\frac{\Gamma \vdash A \text{ type}}{\Gamma, x : A \vdash x : A}_\delta$$

## Derivation

A finite tree where

- **nodes**: inferences
- **root**: conclusion
- **leaves**: hypotheses

E.g.

**Thm** (*element conversion*):

$$\frac{\Gamma \vdash A \doteq A' \text{ type} \quad \Gamma \vdash a : A}{\Gamma \vdash a : A'}$$

**Proof.**

$$\frac{\Gamma \vdash a : A \quad \frac{\frac{\Gamma \vdash A \doteq A' \text{ type}}{\Gamma \vdash A' \doteq A \text{ type}} \doteq_{\text{SYM}} \quad \frac{\Gamma \vdash A' \text{ type}}{\Gamma, x : A' \vdash x : A'} x}{\Gamma, x : A \vdash x : A'} \text{VARCONV} \text{SUBST} \quad \Gamma \vdash a : A'$$

□

## Types

We define types by giving its formation ( $F$ ), congruence ( $=$ ), introduction ( $I$ ), elimination ( $E$ ), and computation ( $\beta/\eta$ ) rules.

### Pi (Dependent function)

$\Pi_{x:A} B(x)$

$$\begin{array}{c} \frac{\Gamma, x : A \vdash B(x) \text{ type}}{\Gamma \vdash \Pi_{x:A} B(x) \text{ type}} \Pi_F \quad \frac{\Gamma \vdash A \doteq A' \quad \Gamma, x : A \vdash B(x) \doteq B'(x)}{\Gamma \vdash \Pi_{x:A} B(x) \doteq \Pi_{x:A'} B'(x) \text{ type}} \Pi_{\text{eq}} \\ \\ \frac{\Gamma, x : A \vdash b(x) : B(x)}{\Gamma \vdash \lambda x. b(x) : \Pi_{x:A} B(x)} \Pi_I \quad \frac{\Gamma \vdash f : \Pi_{x:A} B(x)}{\Gamma, x : A \vdash f x : B(x)} \Pi_E \\ \\ \frac{\Gamma, x : A \vdash b(x) : B(x)}{\Gamma, x : A \vdash (\lambda y. b(y)) x \doteq b(x) : B(x)} \Pi_\beta \quad \frac{\Gamma \vdash f : \Pi_{x:A} B(x)}{\Gamma \vdash \lambda x. f x \doteq f : \Pi_{x:A} B(x)} \Pi_\eta \end{array}$$

**NOTE**  $x.b(x)$  (binding) is a general structural construct, while  $\lambda$  applies to a binding and it is MLTT-specific. It allows a form of “local” substitution.

**NOTE**  $\Pi_\eta$  is normally derivable from EXTENSIONALITY.

$$\frac{\Gamma \vdash f : \Pi_{x:A} B(x) \quad \Gamma \vdash g : \Pi_{x:A} B(x) \quad \Gamma, x : A \vdash f(x) \doteq g(x) : B(x)}{\Gamma \vdash f \doteq g : \Pi_{x:A} B(x)} \text{EXTENSIONALITY}$$

It's convenient to have  $\Pi_\eta$  rule in terms of computation but normally when we study metatheory we want extensionality.

### Non-dependent function

A special const case of  $\Pi$  where codomain does not have dependency on the domain.

$$\frac{\frac{\Gamma \vdash A \text{ type} \quad \Gamma \vdash B \text{ type}}{\Gamma, x : A \vdash B \text{ type}} \Pi_F}{\Gamma \vdash \Pi_{x:A} B \text{ type}} \rightarrow_F$$

$$\Gamma \vdash A \rightarrow B := \Pi_{x:A} B \text{ type}$$

Notice how  $B$  does not depend on  $x$ .

E.g.

$$\frac{\frac{\frac{\Gamma, f : A \rightarrow B \vdash f : A \rightarrow B}{\Gamma, f : A \rightarrow B, x : A \vdash f x : B} \Pi_E}{\Gamma, g : B \rightarrow C, f : A \rightarrow B, x : A \vdash f x : B} \text{WEAKEN} \quad \frac{\frac{\frac{\Gamma, g : B \rightarrow C \vdash g : B \rightarrow C}{\Gamma, g : B \rightarrow C, y : B \vdash g y : C} \Pi_E}{\Gamma, g : B \rightarrow C, f : A \rightarrow B, x : A, y : B \vdash g y : C} \text{WEAKEN}}{\Gamma, g : B \rightarrow C, f : A \rightarrow B, x : A \vdash g (f x) : C} \text{SUBST}$$

$$\frac{\frac{\Gamma, g : B \rightarrow C, f : A \rightarrow B, x : A \vdash g (f x) : C}{\Gamma, g : B \rightarrow C, f : A \rightarrow B \vdash \lambda x. g (f x) : A \rightarrow C} \Pi_I}{\Gamma, g : B \rightarrow C \vdash \lambda f. \lambda x. g (f x) : (A \rightarrow B) \rightarrow (A \rightarrow C)} \Pi_I$$

$$\Gamma \vdash \lambda g. \lambda f. \lambda x. g (f x) : (B \rightarrow C) \rightarrow (A \rightarrow B) \rightarrow (A \rightarrow C)$$

## $\mathbb{N}$ Natural Numbers

$$\frac{}{\vdash \mathbb{N} \text{ type}} \mathbb{N}_F \quad \frac{}{\vdash 0_{\mathbb{N}} : \mathbb{N}} \mathbb{N}_{I_0} \quad \frac{}{\vdash S_{\mathbb{N}} : \mathbb{N} \rightarrow \mathbb{N}} \mathbb{N}_{I_S}$$

$$\frac{\Gamma, n : \mathbb{N} \vdash P(n) \text{ type} \quad \Gamma \vdash p_0 : P(0_{\mathbb{N}}) \quad \Gamma \vdash p_S : \Pi_{n:\mathbb{N}} P(n) \rightarrow P(S_{\mathbb{N}} n)}{\Gamma \vdash \text{ind}_{\mathbb{N}}(p_0, p_S) : \Pi_{n:\mathbb{N}} P(n)} \mathbb{N}_E$$

$$\frac{\dots}{\Gamma \vdash \text{ind}_{\mathbb{N}}(p_0, p_S, 0_{\mathbb{N}}) \doteq p_0 : P(0_{\mathbb{N}})} \mathbb{N}_{\beta_0}$$

$$\frac{\dots}{\Gamma, n : \mathbb{N} \vdash \text{ind}_{\mathbb{N}}(p_0, p_S, S_{\mathbb{N}} n) \doteq \text{ind}_{\mathbb{N}}(p_0, p_S, n) : P(S_{\mathbb{N}} n)} \mathbb{N}_{\beta_S}$$

Example,

```
1 addN: N -> N -> N
2 addN m 0 = m
3 addN m (S n) = S (addN m n)
```

 Haskell

$$\frac{m : \mathbb{N} \vdash \text{add}_{\mathbb{N}} 0 := m : \mathbb{N} \quad m : \mathbb{N}, \text{add}_{\mathbb{N}} S : \mathbb{N} \rightarrow (\mathbb{N} \rightarrow \mathbb{N}) \vdash \text{add}_{\mathbb{N}} S := \text{TODO} : \mathbb{N} \rightarrow (\mathbb{N} \rightarrow \mathbb{N})}{m : \mathbb{N} \vdash \text{add}_{\mathbb{N}} m := \text{ind}_{\mathbb{N}}(\text{add}_{\mathbb{N}} 0 m, \text{add}_{\mathbb{N}} S m) : \mathbb{N} \rightarrow \mathbb{N}}$$

**TODO**

1

$$\frac{}{\Gamma \vdash 1 \text{ type}} 1_F \quad \frac{}{\Gamma \vdash \star : 1} 1_I$$

**NOTE** No elimination rule

0

$$\frac{}{\Gamma \vdash 0 \text{ type}} 0_F \quad \frac{}{\Gamma \vdash \text{ind}_0 : \Pi_{x:0} P(x)} 0_E$$

or, the non-dependent version,  $\text{ind}'_0 : 0 \rightarrow P$

**NOTE**  $\neg P := P \rightarrow 0$

### Sigma (dependent sum/pair)

$$\frac{\Gamma, x : A \vdash B(x) \text{ type}}{\Gamma \vdash \Sigma_{x:A} B(x) \text{ type}} \Sigma_F \quad \frac{}{\Gamma \vdash \text{pair}}$$

**TODO**

### Identity

$$\frac{\Gamma \vdash a : A \quad \Gamma \vdash b : A}{\Gamma \vdash a =_A b \text{ type}} =_F \quad \frac{\Gamma \vdash a : A}{\Gamma \vdash \text{refl}_a : a =_A a} =_I$$

$$\frac{\Gamma, x : A, y : A, p : x = y \vdash P(x, y, p) \text{ type}}{\Gamma \vdash J : \Pi_{x:A} P(\textcolor{red}{x}, \textcolor{red}{x}, \text{refl}_x) \rightarrow \Pi_{x:A} \Pi_{y:A} \Pi_{g:x=_A y} P(\textcolor{red}{x}, \textcolor{red}{y}, g)} =_E$$

$$\frac{\Gamma, x : A, y : A, p : x =_A y \vdash P(x, y, p) \text{ type} \quad \Gamma \vdash d : \Pi_{x:A} P(x, x, \text{refl}_x)}{\Gamma \vdash J(d, a, a, \text{refl}_a) \doteq d(a) : P(a, a, \text{refl}_a)} =_{\text{compute}}$$

So morally,  $J$  rule is converting a proof on two *judgmentally equal* things to two *definitionally equal* things, by eliminating the `refl` constructor that smuggles a *judgmental equality* inside a *definitional equality*.

**NOTE** Notice that by its computation rule,  $J$  is not computable if the proof is not `refl`.

Example.

**Thm** (Transitivity). **TODO**

**TODO** Talk about how PAs hide  $J$  rule away from users, and show two different representations ( $J$  rule vs  $\text{pm}$ )

**Thm** (Symmetry).

**Thm** ( $Ap$ ). If  $a =_A b$  and  $f : A \rightarrow B$ , then  $f(a) =_B f(b)$ .

**Thm** ( $Transport$ ). If  $a =_A b$  and  $B(a)$ , then  $B(b)$ .

### C.H.

**TODO**

- Prop - Type
- Proof - Element
- $\top$  - 1
- $\perp$  - 0
- $P \vee Q$  -  $A + B$
- $P \wedge Q$  -  $A * B$
- $P \Rightarrow Q$  -  $A \rightarrow B$
- $\neg P$  -  $A \rightarrow 0$
- $\exists_x P(x)$  -  $\Sigma_{x:A} P(x)$
- $\forall_x P(x)$  -  $\Pi_{x:A} P(x)$
- $P = Q$  -  $P = Q$
